Prioritize Vulnerabilities. Improve Security.

VULNERABILITY MANAGEMENT OVERVIEW

CompassOne from Blackpoint includes a Vulnerability Management module to give you visibility into the attack surface, including internal networks, external-facing infrastructure, and dark web exposures. The faster you act, the less time attackers have.

Vulnerability Management

Quickly identify, prioritize, and remediate critical security risks, closing the window of opportunity before attackers can exploit them.

Contextual Intelligence

Connects vulnerabilities, misconfigurations, and threats to categorize risk.

Smart Prioritization

Focus on what adversaries are most likely to exploit.

Fast Remediation

Guidance mapped to exposed assets so you can take immediate action.

Automate Scanning

Schedule recurring scans to maintain constant coverage.

Compliance Support

Easily export audit-ready vulnerability reports.

Demonstrate Value

Prove security impact with reports on risks identified and resolved.

> “There was a 180% increase in vulnerability exploitation as a breach entry point.”
>
> *Verizon 2024 DBIR*

blackpoint

FIND THE RISK. FIX WHAT MATTERS. PROVE IT'S WORKING.

Comprehensive Attack Surface Visibility

Internal network scans: Detect vulnerabilities, misconfigurations, and unauthorized devices across your environment, as well as historical context of scans.

External scans: View your environment from an attacker's perspective and close gaps before they're exploited.

Dark web monitoring: Identify credentials and sensitive data exposed on the criminal underground.

Remediate Faster and Smarter

Intelligent prioritization: CompassOne goes beyond CVSS scores by layering in Blackpoint Score exploitability ratings, making it easier to prioritize highest-risk vulnerabilities first.

Guided remediation: Accelerate response with detailed vulnerability info, step-by-step guidance, and asset-to-vulnerability mapping.

Advanced filtering: Group by CVE ID, CVSS score, priority score, and severity to highlight the security gaps that matter the most.

Demonstrate Security Progress

Remediation tracking: Document vulnerabilities found and resolved to show measurable improvement over time.

Compliance-ready exports: Built-in reporting supports PCI DSS, HIPAA, SOC 2, and other framework requirements.

Executive reporting: Monthly summaries of risks identified, prioritized, and resolved make it easy to assess and communicate security posture.

ELIMINATING THREATS WITH AI SPEED AND HUMAN EXPERTISE
